Synthesis of Polysiloxane Modified Zeolites for the Adsorption of Zinc from Aqueous Solutions.

Synthesis of polysiloxane modified zeolites (ZSM-5, ZSM-8, HY) is described. The activated silica-alumina supports were activated using ammonium carbonate, then an appropriate amount of polysiloxane was grafted onto the activated support. The polysiloxane modified zeolites were characterized using N<sub>2</sub> adsorption, infrared spectroscopy, surface area and surface acidity. The results showed that the preparation of polysiloxane modified zeolites provided

---

a higher surface area and a higher amount of acid sites. In addition, the adsorption of Zn(II) by the modified zeolites at pH = 2.0 was investigated and the data obtained were fitted to the Langmuir isotherm model. From the adsorption kinetics, it was found that the adsorption capacity of ZSM-5 increased first and then decreased, and the adsorption capacity of ZSM-8 increased from 0.4 to 1.0 mmol/g and then decreased to 0.4 mmol/g, while the adsorption capacity of HY increased from 0.7 to 0.9 mmol/g and then decreased to 0.6 mmol/g. The ZSM-5 modified with polysiloxane showed a higher adsorption capacity than the other modified zeolites, but it decreased rapidly after reaching the equilibrium and the adsorption capacity of HY was more than that of ZSM-5 and ZSM-8. Keith Asboe Keith Asboe (born 12 October
