New clinical guidelines for the diagnosis and management of post-polio syndrome. Post-polio syndrome (PPS) is an important and yet under-recognized condition affecting a significant number of people who have experienced acute polio-like episodes with upper motor neuron paralysis. The

diagnosis of PPS is based on criteria for acute polio-like illness requiring therapeutic intervention, followed by a loss of at least 50% of baseline upper and/or lower limb strength or range of motion. Within 1 to 2 years of onset of weakness, patients may develop symptoms that meet the diagnostic criteria of a somatic symptom disorder. The etiology and pathophysiology of PPS are still not completely understood. There is no known cure, and PPS has been linked to cardiovascular disease, increased levels of depression, and impaired quality of life. Until more is known ba244e880a
