Any help will be appreciated A: You are trying to decode utf-8 encoded bytes with ASCII. This isn't a problem. Use the bytes directly.

```
import jcifs
import zlib
import io
import os
import sys
import time

def write_bytes(buf, fname):
    with open(fname, 'wb') as f:
        f.write(buf)

def load_bytestring(fname):
    with open(fname, 'rb') as f:
        return f.read()

def decode_bytes(buf):
    return bin(buf)[2:].decode('utf8').encode('utf-8')

def bytes_to_date(time_str):
    return time.strptime(time_str, '%b %d %Y')

def bytes_to_time(time_str):
    return time.strptime(time_str, '%b %d %Y %I:%M %p')

def compress_bytes(bytes):
    with jcifs.connect(source_folder,
                     username=source_username,
                     password=source_password) as c:
        with jcifs.connect(destination_folder,
                           username=destination_username,
                           password=destination_password) as d:
            jcifs.pushd(source_folder)
            jcifs.setfiletimes(d)
            try:
                with zlib.gzip(bytes) as gzip:
                    with open(d, 'w') as dst:
                        dst.write(gzip.read())
                        dst.write('
```

The paper presents the work undertaken during the last few years in the field of risk assessment of nerve agents. As the main focus, the review addresses the interrelationships among dose, structure, and response, which are most important in clinical toxicology. With the view of the toxicokinetics of nerve agents, emphasis has been laid on the drug's absorption, distribution, metabolism, and excretion. There are also certain aspects of the clinical toxicology of nerve agents, for example, the consideration of their neurotoxicity and the search for parameters that 570a42141b
