Q: AUC of SVM classification I am trying to understand why SVM classifier gives the AUC of 0.65. I have done the following: I took 20 examples of the dataset and fit a SVM to it. I then took the 20 examples and tried to classify a new example using the SVM model. I checked whether it classified

---

correctly or not. It always classified correctly. Then I took the same 20 examples and changed the SVM's hyperplane to another random position on the data space. I checked again if it classified correctly or not. It was always incorrect. This is how I did the experiment: Step 1: Generate 20 samples from a dataset of 1,000 points. (The data can be obtained from a sample dataset file). Step 2: Fit the SVM to these 20 samples. (The 20 samples could be from the

---

same class, or from different classes). Step 3: Take a new sample from the data space. Step 4: Using the SVM predict its class. Step 5: Check if the new sample is classified correctly. (If the new sample is from the same class, check if it was classified correctly. If the new sample is from a different class, check if it was classified correctly). Step 6: Change the SVM's hyperplane to a different random position on the data space. Step 7: Again check if the new

---

sample is classified correctly. Step 8: Check if the new sample was classified correctly after the hyperplane has been changed. I did this for 200 samples. The result is that the AUC for this 200 samples is ~0.65. My question is: I can only think of 2

how to import CAD data into your drawing. Users can incorporate feedback from a base drawing or from a separate editable drawing into their design. 3D modeling with DraftSight: CAD with 3D capability now automatically creates 3D models. DraftSight for CAD adds dynamic, 3D views that work even in your design. Edit the 3D model from the same interface, and the changes are instantly applied to the 3D view. DraftSight for CAD provides

---

dynamic 3D views and editing capabilities that work even when you work in non-3D AutoCAD. The 3D views are dynamic; views are repositioned according to changes made to the CAD model. Automatic conversion of DWG and DXF files to 3D: Rapidly create 3D views from DWG and DXF files with one command. Create 3D views from CAD drawings or models that are saved in a variety of file formats. If your drawings are saved in another

---

file format, the 3D view is automatically converted. DraftSight for CAD supports AutoCAD drawings saved in DWG (2004 and later) and DXF formats. The 3D views are dynamic; views are repositioned according to changes made to the DWG or DXF files. 3D modeling with DesignIntelligence for Revit: Combine 3D modeling with Revit 2018. DesignIntelligence for Revit enables you to generate a 3D model based on the structural

---

elements and features in your 2D Revit model. The resulting 3D model reflects changes made to the 2D model. Revit 2018 provides a complete solution for creating and managing your project in both 2D and 3D. Revit provides tools to quickly and easily produce 2D drawings and 3D models and share your designs with others. DraftSight for Revit provides dynamic 3D views and editing capabilities that work even when you work in non-3D Revit.
