An IoT security researcher has uncovered two critical vulnerabilities in devices from the Chinese startup Xiaomi. The two vulnerabilities, revealed in a research published Thursday on the publishing site TISg, are believed to affect not only Xiaomi's devices but also those from other companies which makes use of the same type of True Type Architecture (TTA)—a chip architecture used by many IoT devices. According to TISg, the two vulnerabilities affect Xiaomi products which have built-in accelerometers. A firmware update for most devices is already available, although some Xiaomi devices are known to not be among the affected ones. The first vulnerability found by security researcher Michiel Prins relates to the way TTA accelerometers work. The manufacturer's firmware expects the accelerometer to respond only to a couple of updates at a time. The problem is that in these updates only the acceleration is measured, but the orientation data is not collected. "Due to this missing orientation, we can overwrite the accelerometer. All we have to do is force the accelerometer by a couple of millimeter using the user's hands or even a simple hammer." Michiel Prins, the researcher who discovered one of the flaws, said in a video demonstration. If we do this, we are able to modify the accelerometer value, for example to get 1 g [gravitational acceleration] instead of 0.56 g. In that case the orientation of the device will also change. If the orientation change exceeds 30 degrees, the accelerometer will become completely useless." Michiel Prins, the researcher who discovered one of the flaws, said in a video demonstration. The second vulnerability found by security researcher Michiel Prins relates to the way TTA accelerometers are initialized. TTA accelerometers need a firmware-defined key to be initialized and left in a specific state before responding 82138339de
