Tuberculous meningoencephalomyelitis (TBM) and tuberculous encephalitis (TBE) are the most common forms of extrapulmonary tuberculosis, which are characterized by involvement of the central nervous system. A characteristic of TBM and TBE is their poor response to drug treatment and frequent relapse after completion of therapy, making clinical diagnosis difficult. \[\[@ref1]\] The diagnosis of TBE is difficult and the clinical presentation is often unspecific. \[\[@ref2]\] Most of the cases of TBE are associated with other systemic conditions (HTLV-1 in 40-60%, HIV in 20-40%, and diabetes mellitus in 4-14%) \[\[@ref3]\] and the overall mortality rate is estimated to be as high as 65%. \[\[@ref4]\] We present a case of tuberculous encephalitis that mimicked an acute stroke. This was a young lady who presented with headache, altered sensorium, and right-sided limb weakness. She had no other significant medical or surgical history.

## What's New In Crysis Benchmark Tool?

The initial page of Crysis Benchmark Tool is a list of benchmarks you wish to run. This page is reached after selecting a test from the main menu. Options: On the next screen you will be presented with three options: Debug Output -- When selected, the Crysis program will be run as normal, but you will be able to view the source code and have the code displayed in the window in front of you. This makes it possible to verify that the results of a benchmark are accurate and that the number of frames is correct. In addition, if any of your tests are corrupt, you can use this tool to quickly fix it. If you run the benchmark again, the results will automatically be re-calculated using the fixed values. This will speed up your testing process considerably. Run & Compare -- When this is selected, the current benchmark will be compared to the previous benchmark. Any differences are highlighted in the window. Run All -- If this option is selected, the program will run a benchmark for every test. You can select a single test for which you wish to run a benchmark. The program will then automatically display the results of that test. When you have selected the tests you wish to run, you can also select the number of runs that will be used in your comparison. The program will then display a graph that will give you the results of the test. You will then have the option of viewing the details for each test and the overall results. Crysis Benchmark Tool is a useful tool for determining if your computer has the hardware needed to run a game at a playable framerate. It can also be used to quickly test your computer for any issues and spot whether there are any abnormal results in your benchmark test. [Click here to see Crysis Benchmark](#)
