Note When choosing between Photoshop and Adobe Elements, look at the features each has. Elements has a great deal more capabilities, but once you know Photoshop, it's easy to switch. Elements is also the best program for Windows. * **Florence** _(www.florence.com)_ is an entirely different type of program. It enables you to make a graphic, as well as choose the typeface and layout. You select a photo or typeface from a library and then the program allows you to include other objects, such as furniture and other decorations, and place them on the page. It's great for weddings and conventions. # Chapter 2. Raw Images You can develop professional-quality images from your digital camera right in your computer. In fact, the latest Canon cameras have a special Raw format, one that enables you to take your camera's native digital images and automatically edit them in your computer. You don't have to buy a special Raw-format (RAW) card to use your camera's image data. Your camera uses a Compact Flash card that already contains the raw data. (See the right.) RAW images have a lot more data than JPEG or TIFF images. JPEGs and TIFFs compress the image and can't hold the necessary information to create what's known as a _full-color_ or _true-color_ (also called _uncompressed_) image. * **Nikon D2x.** The Nikon D2x uses its own RAW format. You get 12 RAW images with each camera. It's better to use the 5-minute Photo Mode when taking photos. Nikon's Photo Mode is perfect for BMP images. * **Canon E

Q: python / flask generate list based on unique value in column Using flask, I want to grab the unique names from a column in a pandas dataframe, and put them into an array. I've tried using a counter, but it only gives me the last row. I've also tried using a list comprehension, but the code doesn't work. for i in df['Location']: #counter = 0 listOfNames[i] = listOfNames.index(i) + 1 How can I get a list of all unique values of a column? A: If you want a list of unique values, you just need to use set: for i in df['Location']: lst = set(df['Location']) listOfNames.append(i) This will actually create a set from your list. You can turn it back into a list after that with: listOfNames = list(lst) If you want a list of unique values from this, you can use list(lst.values) instead of list(lst). For your sample code, though, I think this is a bit easier: listOfNames = [] for i in df['Location']: listOfNames.append(i) If this code only runs once, it's equivalent. If it runs more than once, it will update the list. Q: Creating a UISegmented Control I'm creating an app, where I need to create a UISegmented Control. If you know what I'm talking about, could you please help me in creating a UISegmented Control. Thank you. A: If you are using Interface Builder, the UISegment Control is under Attributes Inspector. There are four sections and four sub-sections. Each one is a different color. If you are writing it in code, here is how to create it from scratch: UISegmentControl * segmentedControl = [[UISegmentControl alloc] initWithItems:@[@"one", @"two", @"three", @"four"]]; segmentedControl.selectedSegmentIndex = 0;

The discovery of a previously unknown bug in the bitcoin blockchain — which the company claims is “tentatively the worst vulnerability in the world” — is likely to catch the attention of regulators worldwide, as well as concerns that the Russian government will try to use the bug to stifle cryptocurrencies. The discovery by an East German cryptography expert, who has not been named or revealed his background for security reasons, will initially be kept secret to preserve the anonymity of the researcher. The bug, discovered by a team of four at a risk consultancy firm called White Ops, and reported to a leading bitcoin security firm, was in an ancient program, called the “getbestblock” function in the bitcoin source code, written at the beginning of 2013. According to White Ops, the code “can be used by a malicious peer in a coordinated fashion to modify transaction and block balances on the network.” The bug only affects a single bitcoin blockchain version, version 0.8, which was released in December 2013. When this code was released, there were only 21 million bitcoins in existence. The existence of an unlimited supply of this type of cryptocurrency was a principal driver of bitcoin’s immense recent appreciation, and the adoption of bitcoin by the Russian government was one of the big drivers of this appreciation. This bug means that bitcoin was released with a bug that allows somebody to control billions of dollars’ worth of the bitcoin network. The discovery of this bug has drawn sharp criticism of the bitcoin network from the bitcoin developer Gavin Andresen, who is the director of the Bitcoin Foundation. ◆
