Photoshop is the most common Photoshop alternative, and Photoshop is the default file type for any kind of file or format. Every Photoshop file contains a graphic editing file, which can be an image or a vector graphic, and a Photoshop file, which contains instructions about how the image will look when printed or displayed. Photoshop elements version 12 to 16 contained both Photoshop and an "elements" editing file. Version 17 and later

contained only Photoshop files. A Photoshop file is an image editing file with instructions about how the image will look when printed or displayed. Elements file is a special Photoshop file. There is a variety of digital photography software available such as the default camera and smartphone apps for iOS and Android, as well as dedicated dedicated photography apps, the review of which will be published here. The users of Mac and Linux as well as Windows, however, do not have to worry about the lack of

dedicated apps for editing photos and graphics. There is a free software called Gimp - Graphics Interchange Format, an open source project available for Linux, Mac, Windows and Android. It is designed to do what Photoshop does. Note that Photoshop and the Gimp share a similar set of tools. This includes the ability to edit layers and masks, use brushes, and paint with vectors. Both programs provide a similar workflow for editing images. In addition, the Gimp can do vector editing.

GIMP has more limitations, however. It is designed to edit images in the basic mode (RGB - Red, Green, Blue), while Photoshop offers additional color editing (add LAB coloring if you want). Adobe Photoshop Photoshop is a professional photo editing program for digital images. It comes with a variety of editing tools. The free version has a trial period, which is not limited and there are no additional charges if you decide to buy the software (except for pro features, which are not free). Photoshop

Layers: Photoshop's Layers are a feature that most designers use every day. A Layer, once created, can be turned into a new document, adjusted, moved, rotated, scaled, and much more. This is great for working with large, complicated images. In Camera Raw: In-camera RAW (or Camera Raw, as Adobe calls it) lets photographers process RAW-format digital images. The software offers a host of useful options for adjusting exposure,

white balance, hue and saturation, sharpness, and more.

Backgrounds: The Backgrounds

Tool lets you change the

background of a selected layer.

The **Gradient Tool** lets you add or subtract colors, simply by

dragging the soft-edged rectangle.

This is a real timesaver when you need to create semi-transparent

backgrounds. The **Shadows /**

Highlights Tool lets you increase

or decrease the exposure of the

light and dark colors in a selected

image. The **Size Tool** lets you

scale layer and image sizes, which

is handy for when you're finished cropping a specific area. **Fonts:** The Fonts tool lets you customize the fonts used throughout Photoshop. It also allows you to apply a custom font from the web. When working with Photoshop's File menu, you have options to change the font, size, color, and more. You can use the Paths tool to draw paths for creating text outlines, shapes, and more. These paths can be adjusted with the path selector tool. **Fireworks:** A tool for web designers that is less complicated

to use than Photoshop, Fireworks offers many of the features that designers expect. It's a versatile tool with an easy-to-use interface. The Transform tools let you move images around on the page, or zoom in to check a detail. The Canvas tool is a bit like a virtual canvas, letting you draw anywhere on the screen. The Crop tool can be used to make specific areas of a specific layer visible. The Channels toolbar lets you add, remove, and edit different kinds of channel content. The Text tool lets you manipulate text in ways

similar to those of Photoshop's text tools. Multimedia Fusion: Multimedia Fusion lets you combine videos, music, photos, and other multimedia elements with Adobe's After Effects software. Using this app, you can add titles and animations, or use the

FREMONT, Calif. (KGO) -- If you're thinking about switching to an electric car, here's how it works. Plug it in, take a test drive,

then go back to charging and your car will eventually be fully charged. The next day you can drive it off. But until then, it's connected to a power source and in effect, it's powered by the energy grid. That's called "net zero" and it's just becoming real. Researchers have been developing the technology for decades. The goal is to produce electric vehicles that are as good as a regular car, but don't use any fuel at all. It's complicated, but not nearly as complicated as you might think. If you want to buy an

electric car, you'll need to go solar, too. Go to carsolar.com. The Cascades Solar Co. is based out of Fremont. Solar's a perfect match for electric cars because they can use both. The big problem for electric cars is range, said Cascades' founder Andy Bogue. "I think people are buying electric cars because they want to say 'I'm more green' or because they want to travel a long way, or they want to feel better about themselves. It's selling green," Bogue said. Cascades' simple system can turn a rooftop into a

mini solar power plant. Bogue is selling a solar panel that hooks to the car's battery. The car gets a charging boost from the sun, and when the battery runs out of juice, the car recharges itself at night. The only drawback is that the sun is never going to be shining in Fremont. "We've got about 5,000 watts per square foot in summer, and 3,500 watts per square foot in winter, so 1,000 square feet," Bogue said. In less than an hour, you'll have enough energy to power an EV for about an hour. Cascades, for example,

has a 10 kilowatt system that can charge an electric car more than once a day. But until solar becomes a smaller part of the equation, more houses need to power their whole neighborhoods with solar. Bogue admits that idea is "about as cheap as they come." Cascades is still selling small rooftop systems that cost about \$10,000, and that's a big problem because the sun doesn't shine much at night. That's when the battery has to work. Bogue says that number is going to go way
